

Engineering partner for practical, affordable sustainability.

The Challenge

- Your consulting plays a critical role in helping organizations understand the business value of sustainability and commit to meaningful targets
- Engineering is often required to identify and implement practical, affordable measures, and we would welcome the opportunity to work alongside you in delivering a holistic roadmap

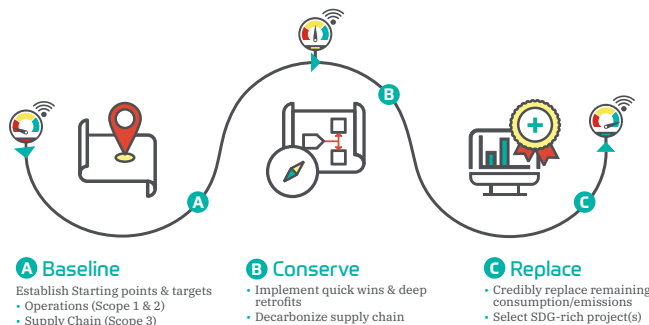

Collaborating for Sustainability

Credible sustainability reporting requires a compelling story to tell.

Maple Leaf Foods worked with a firm to create an overall sustainability plan on their journey to carbon neutral, but when it came to the on-the-ground assessment, they brought in Enviro-Stewards. We identified practical, affordable Scope 1 and 2 measures that delivered more than \$17 million (and counting) in combined plant savings and made a significant contribution toward achieving the company's targets, helping them become the [world's first major carbon neutral food company!](#)

Enviro-Stewards recently developed the [Stewwi](#) EMIS (Energy Management Information System) to guide clients

[System to Track Energy, Water, and Waste Improvements \(Stewwi\)](#)

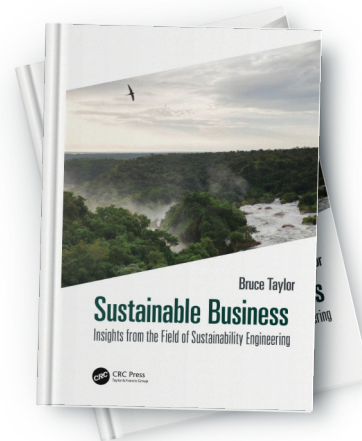

from establishing baselines through to securing their water, energy, and waste targets. The platform makes use of live sensors to track the outcomes of each conservation measure and custom algorithms to generate notices when the gains are not maintained.

Case Study: Unilever ([Sustainable Business Textbook Excerpt](#))

Unilever is embarking on an inspirational sustainability journey to eliminate carbon emissions from their production facilities by 2030.

Enviro-Stewards' ([award winning](#)) action plan for Unilever's Hellmann's facility will reduce the facility's thermal energy consumption by a half to two thirds, electrify the remainder, and credibly replenish the remaining consumption.

Next Step
